Dependencies & Dev dependencies:

Sunday, 26 April 2026 3:27 AM

Dev-dependencies :-

Building Tools.

things you need during creation or construction but not a part of completed project.

Example :- Testing and Code formatting. ⇒ Nodemon.

Dependencies :- → Essentials. Part

⊛ Package of your app needs to function.

These are the final part of your project!

Example :- Express.js

For installing normal dependency

npm install <package>

Difference :-

Dependency only needed in development while in production dev-dependencies needed.

Note :- npm install - production

only package listed in dependencies will be installed.

To install package as dev-dependency use :- npm install <package> -- save-dev

To remove npm package :-

npm remove <package>

During creation of package of json when running npm init is not default.
