nodemon,package.json and npm:

Sunday, 26 April 2026 3:09 AM

1. Create your json File :-

npm init

either you can change version name & number inside terminal or you can leave it.

Why do we need Package.json ?

Let say you are working on a project in a group so rather than telling each people what you did till now in this project this package.json will track all the thing whatever you have worked on cause it will keep track of all the details of your project so they just have to do is npm.install & they will get all the details. (Packages.json used to specify the script to run command)

Example :- you added Fs using

npm i Fs.

it will bring the dependencies inside the package.json. So it is very important. (Basically defines project, meta-data, dependencies and scripts)

NODEMON :-

npm i nodemon.

Nodemon :- helps to restart or refresh server automatically whenever you make changes.

to run this :- Nodemon index.js

file name

to install nodemon globally

npm install -g nodemon
